

I believe that learning styles massively impact how each of us learn. We all have different ways of learning, whether it's tactile, auditory or visual. I am of the opinion that everyone is a mixture of all three, but that the percentages vary wildly. If someone who was more of a visual learner, but was forced to just listen to instructions, they would have a more difficult time learning it than they would seeing something being done. It wouldn't be impossible for them to do so, as humans are highly adaptable for the most part. It would just take longer for them to acquire that knowledge. But why would we need to make it unnecessarily difficult? I think that it would be more worthwhile to give people multiple different ways of interpreting the material in a course, while also teaching them to view different perspectives to hinder isolation. If we could view more perspectives from different people, I think we would have a much better understanding of other cultures, religions, and ideologies, within reason. There is a problem with extremism, and extreme ideologies should be made known to people, but with great caution. If we keep open minds, keep expanding our knowledge, and keep a good understanding of why people operate the way they do, then these issues caused by extremism would be greatly reduced.
